Type: Oral Presentation

Neutronics Performance of CSNS Moderators

The China Spallation Neutron Source (CSNS) is an accelerator based multidiscipline user facility constructed in Dongguan, Guangdong, China. The CSNS consists of a linear accelerator, a rapid cycling proton synchrotron accelerating the beam to 1.6 GeV energy, a solid tungsten target station, and three instruments in phase one for neutron scattering applications.

The neutron wavelength spectra ($>0.286\text{\AA}$) of three moderators, 20K Coupled Hydrogen Moderator(CHM), 20K Decoupled and Poisoned Hydrogen Moderator(DPHM) and room temperature Decoupled Water Moderator(DWM), were measured at beamline 1# 6# 9# and 20# by low efficiency He3 neutron detector and lithium glass neutron detector applying TOF method. The neutronic performance of the moderators provides evidence of strong coupling between the target and the moderators. The integral flux of cold and thermal neutron was verified by activation measurement of gold foil. The integral flux of three moderators is agree with the simulation results of engineering geometry model within 20%. The neutron pulse shape of DPHM was measured by time focusing technique and agree well with the simulation result. The detail of measurement methods and results and MC simulation will be introduced.

Primary author: Dr LIANG, Tianjiao (Dongguan Branch, Institute of High Energy Physics, CAS)

Co-authors: Mr WANG, Songlin (CSNS, Institute of high energy physics, CAS); Dr SHEN, Fei (CSNS, Institute of high energy physics, CAS); Mr ZHOU, Bin (CSNS, Institute of high energy physics, CAS); Mr HU, Zhiliang (CSNS, Institute of high energy physics, CAS); YIN, Wen (Institute of High Energy Physics, Chinese Academy of Sciences)

Presenter: Dr LIANG, Tianjiao (Dongguan Branch, Institute of High Energy Physics, CAS)

Session Classification: Target

Track Classification: Target/Moderator
