Experiments orchestration and control software layer for SIRIUS accelerator and beamlines

Érico N. Rolim

ICALEPCS EPICS Collab Meeting 2023

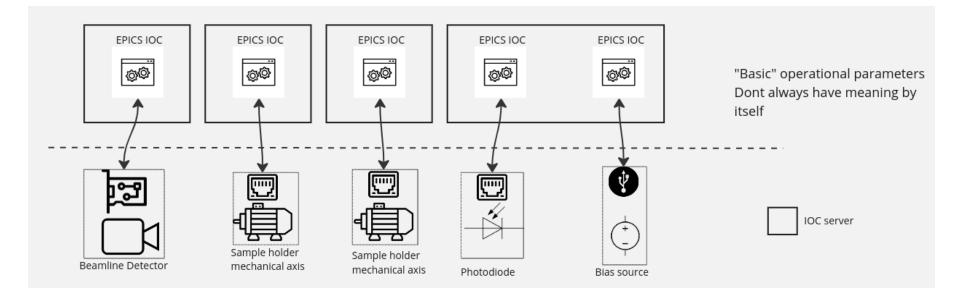

Overview

- Basic control software architecture in Sirius
- Beyond the basic I/O: current challenges in orchestration
- Possible solutions and current implementations

Basic control software architecture

 Multiple equipment controlled by EPICS IOCs "Raw" parameters sometimes have little meaning to the end user

Basic control software architecture

- Software-only IOCs process basic operational parameters, extracting meaning;
- E.g.: voltage and sensitivity of photodiode are converted into current, a set of mechanical axes are converted into kinematic axes...

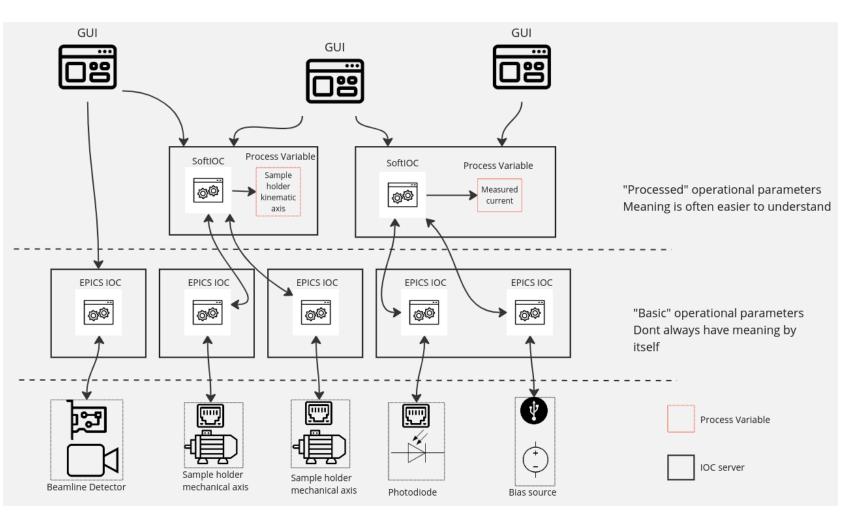

• Finally, users interact with parameters of interest via GUIs.

Current challenges in orchestration

Current challenges in orchestration

We need something to... GUI Organize all the "atomic" ... into a single, coherent Open file with ****************** Command detector to desired metadata acquire etc. etc... 1.....X.... Check motor position Command Abort scan motor to move SoftIOC EPICS IOC EPICS IOC SoftIOC IOC ^ش ^ۋۋ \$ \$ ¢¢

operation parameters

and meaningful set.

Current challenges in orchestration

Four options are currently being used in different scenarios:

yDM GUIs (quick, easy and dangerous):

- Easily customized by beamline staff;
- Small developing time;

Yes, but...

- GUI crash/close = process might be left hanging;
- Process is "stuck" to the user running the GUI.

PCASpy softIOC:

- Easily customized;
- Small development time;
- Easily managed by
- several users; Made to be constantly
- running; Yes, but...
- Performance is far from ideal;
- Doesn't get CA server updates from EPICS BASE;
- How to "port" PCASpy
 code to PVAccess?

Sequencer softIOC:

- Easily managed by several users;
- Made to be constantly running;
- Highly performatic; Yes, but...
- Bigger developmenttime;
- Learning curve for non-epics developers is considerable.

- ed by
 Easily managed by several users;
 Server constantly
- unning; running, clients rmatic; can connect .. whenever they
 - want; Yes, but...

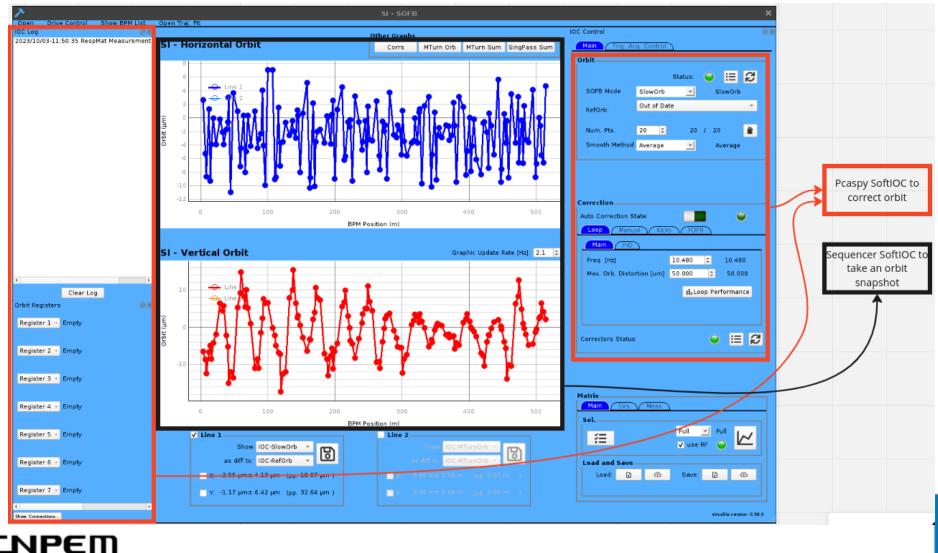

Bluesky scans:

- Learning curve is considerable, not as much as sequencer;
- No defined GUI situation

- si

Possible solutions

Bluesky vs. SoftIOC

- Any specific criterion for choosing one vs. another?
- Is the states machine concept well embedded into bluesky?

Sequencer: PVAccess support?

- What is the future of sequencer with PVAccess?
- Currently, sequencer has many tools to directly work with C.A. in .stt files. Will this also be true for P.V.A?

Legacy PCASpy SoftIOCs:

- We need to port old PCASpy code to more modern solutions.
 What are our options?
- Possibly: Python SoftIOC, PVAPy, any more...?

In conclusion

• We seek solutions for experiments orchestration and old softIOCs code portability for P.V.A. Both demands seem to ask for similar solutions;

• Several attractive tools are available. Which are the ones most aligned with the community goals/perspectives?

Thank you!

These discussions have been in happening in SIRIUS's Data Acquisition and Processing Division (DAP), Control Software Group (SwC), and in the Accelerator Physics Group (FAC).
